

Address Assistance Online

An internet based solution that will make your job easier.
We guarantee it!

PoconoGIS introduces an internet based solution that makes managing complex address data sets simple. The application is easy to use and the secure website can be accessed from any computer via the web. Built using Microsoft SQL Server 2008 technology, this stand-alone solution requires no proprietary mapping software or licensing. Tiered user access provides the following functionality:

Search for Records

Users can search existing records using standard queries. The matching records are quickly returned for printing, viewing, and editing.

Intuitive Map Interface

Records are displayed on a map. The user can pan, zoom and query records from the map interface. Typical map layers include Aerial Photography, Parcels, Addresses, Streets, Labels, etc.

Add and Edit Records

New address points are geocoded on-the-fly and validated to make sure there are no duplicates. Data input forms allow users to enter and edit data. Edits are saved directly to the server.

Automated Notifications

Quickly generate standardized letters to notify residents. Send email notifications to the U.S. Post Office or the resident with a simple click of a button.

Enterprise Integration

Connect the server using ArcMap (or other desktop mapping solution) to view and query the data or create high quality cartographic documents.

Bill Chappell from PoconoGIS says *"This new solution reduces our client's out-of-pocket expenses and provides a mechanism to easily manage address datasets without getting bogged down with the technology."*
